WORKSHEET 5

Student Name: Shubham Chauhan   **UID:22BCS11888**

Branch: CSE   **Section/Group: NTPP 603/B**

Semester: 06   **Date of Performance: 27/02/2025**

Subject Name: AP Lab II   **Subject Code: 22CSP-351**

1. Aim:

a. Merge Sorted Array

b. First Bad Version

c. Kth Largest Element in an Array

2. Source Code:

a.

```java
class Solution {
    public void merge(int[] nums1, int m, int[] nums2, int n) {
        int i = m - 1; // pointer for nums1
        int j = n - 1; // pointer for nums2
        int k = m + n - 1; // pointer for the last index of nums1

        while (i >= 0 && j >= 0) {
            if (nums1[i] > nums2[j]) {
                nums1[k] = nums1[i];
                i--;
            } else {
                nums1[k] = nums2[j];
```

```
            j--;
        }
        k--;
    }

    while (j >= 0) {

        nums1[k] = nums2[j];

        j--;

        k--;

    }

    }
}
```

b.

```java
/* The isBadVersion API is defined in the parent class VersionControl.
      boolean isBadVersion(int version); */

public class Solution extends VersionControl {
    public int firstBadVersion(int n) {
        int low = 1;
        int high = n;

        while (low < high) {
            int mid = low + (high - low) / 2;  // Avoid overflow
            if (isBadVersion(mid)) {
                high = mid;  // The first bad version is at mid or before it
```

```java
        } else {
            low = mid + 1;  // The first bad version is after mid
        }
    }

    // At the end of the loop, low == high, pointing to the first bad version
    return low;
    }
}
```

C.

```java
import java.util.PriorityQueue;

public class Solution {
    public int findKthLargest(int[] nums, int k) {
        PriorityQueue<Integer> minHeap = new PriorityQueue<>();

        for (int num : nums) {
            minHeap.add(num);

            if (minHeap.size() > k) {
                minHeap.poll();
            }
        }

        return minHeap.peek();
    }
```

```java
    public static void main(String[] args) {

        Solution solution = new Solution();

        // Example 1

        int[] nums1 = {3, 2, 1, 5, 6, 4};

        int k1 = 2;

        System.out.println("Kth largest element: " + solution.findKthLargest(nums1, k1));
// Expected output: 5

        // Example 2

        int[] nums2 = {3, 2, 3, 1, 2, 4, 5, 5, 6};

        int k2 = 4;

        System.out.println("Kth largest element: " + solution.findKthLargest(nums2, k2));
// Expected output: 4

    }
}
```
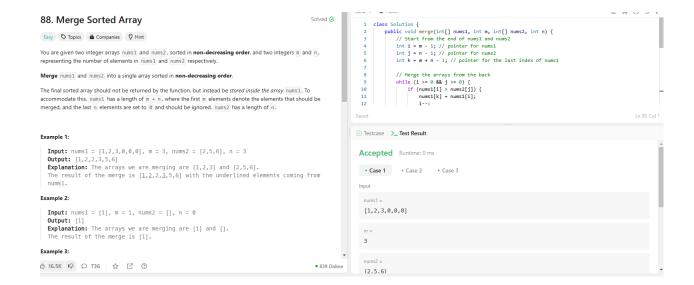

3. Screenshot of Outputs:

a.

88. Merge Sorted Array

Solved ✓

Easy | ◇ Topics | 🔒 Companies | ⚲ Hint

You are given two integer arrays `nums1` and `nums2`, sorted in **non-decreasing order**, and two integers `m` and `n`, representing the number of elements in `nums1` and `nums2` respectively.

Merge `nums1` and `nums2` into a single array sorted in **non-decreasing order**.

The final sorted array should not be returned by the function, but instead be *stored inside the array* `nums1`. To accommodate this, `nums1` has a length of `m + n`, where the first `m` elements denote the elements that should be merged, and the last `n` elements are set to `0` and should be ignored. `nums2` has a length of `n`.

Example 1:

```
Input: nums1 = [1,2,3,0,0,0], m = 3, nums2 = [2,5,6], n = 3
Output: [1,2,2,3,5,6]
Explanation: The arrays we are merging are [1,2,3] and [2,5,6].
The result of the merge is [1,2,2,3,5,6] with the underlined elements coming from
nums1.
```

Example 2:

```
Input: nums1 = [1], m = 1, nums2 = [], n = 0
Output: [1]
Explanation: The arrays we are merging are [1] and [].
The result of the merge is [1].
```

Example 3:

👍 16.5K 👎 💬 736 ☆ ⎘ ⊘   • 839 Online

```java
1   class Solution {
2       public void merge(int[] nums1, int m, int[] nums2, int n) {
3           // Start from the end of nums1 and nums2
4           int i = m - 1; // pointer for nums1
5           int j = n - 1; // pointer for nums2
6           int k = m + n - 1; // pointer for the last index of nums1
7
8           // Merge the arrays from the back
9           while (i >= 0 && j >= 0) {
10              if (nums1[i] > nums2[j]) {
11                  nums1[k] = nums1[i];
12                  i--;
```

Accepted Runtime: 0 ms

• Case 1 • Case 2 • Case 3

Input

nums1 =
[1,2,3,0,0,0]

m =
3

nums2 =
[2,5,6]

b.

278. First Bad Version

Solved ✓

Easy | ◇ Topics | 🔒 Companies

You are a product manager and currently leading a team to develop a new product. Unfortunately, the latest version of your product fails the quality check. Since each version is developed based on the previous version, all the versions after a bad version are also bad.

Suppose you have `n` versions `[1, 2, ..., n]` and you want to find out the first bad one, which causes all the following ones to be bad.

You are given an API `bool isBadVersion(version)` which returns whether `version` is bad. Implement a function to find the first bad version. You should minimize the number of calls to the API.

Example 1:

```
Input: n = 5, bad = 4
Output: 4
Explanation:
call isBadVersion(3) -> false
call isBadVersion(5) -> true
call isBadVersion(4) -> true
Then 4 is the first bad version.
```

Example 2:

```
Input: n = 1, bad = 1
Output: 1
```

• Case 1 • Case 2

Input

n =
1

bad =
1

Output

c.

215. Kth Largest Element in an Array   Solved ✓

Medium   ○ Topics   🔒 Companies

Given an integer array nums and an integer k, return the kth largest element in the array.

Note that it is the kth largest element in the sorted order, not the kth distinct element.

Can you solve it without sorting?

Example 1:

```
Input: nums = [3,2,1,5,6,4], k = 2
Output: 5
```

Example 2:

```
Input: nums = [3,2,3,1,2,4,5,5,6], k = 4
Output: 4
```

Constraints:

▸ `1 <= k <= nums.length <= 10^5`

▸ `-10^4 <= nums[i] <= 10^4`
